Static members

↓

Variable → Shared by all objects of a class

```
Class counter {

    public
        static int count;

        counter () {
                count ++;
        }

};

int counter :: count = 0;

int main () {
    counter a, b, c;
}
```

→ Static member must be defined outside the class

output << 3

Static function → uses only static variables and is declared inside the class.

↓

It does not need an object to be called

it can be called like

class :: Static func name in main

↓

is just a class function
